

AI Tool Usage

I used ChatGPT as a coding assistant during the development of this project. It helped me understand the requirements, troubleshoot errors, and get guidance while implementing different parts of the application.

I used AI assistance for debugging, refining code, understanding the architecture, and improving documentation. I implemented and integrated the code into the project, ran it locally, tested the functionality, and fixed issues based on the actual outputs and errors I encountered.

ChatGPT was also used to help with documentation such as the README, architecture note, and product note.
